Abstract The study reported the results of clinical observation of Shenqi Yigan Granules (self-made Chinese traditional patient medicine) in treating patients with chronic hepatitis B. 304 patients were classified into two groups at random, the investigation group was treated with Shenqi Yigan Granules, the control group was treated with Gan Bi Fu. The periods of treatment of both the groups were six months. As a result, the total effective rate, HBeAg negative conversion rate, HBV-DNA negative conversion rate of the investigation group and the control group were 74.52%, 51.6%, 51.5% and 60.42%, 35.1%, 23.8%, respectively. A significant difference was found between the two groups ($p < 0.05$). The results of clinical observation showed that Shenqi Yigan Granules had more obviously curative effects than Gan Bi Fu in the remission of symptoms, in improvement of liver function and virus maker of hepatitis B turning negative. It was confirmed by animal experiment and clinical observation that Shenqi Yigan Granules had little toxic and side effect. It had many advantages, such as extensive sources of the medicine, cheap price, convenient preparation, carrying and taking the medicine easily, so it was worth extensive clinical practice.
